Chapter 2 Introduction

This integration manual describes the integration requirements for FEE Driver for S32K14X microcontrollers.

2.1 Supported Derivatives

The software described in this document is intented to be used with the following microcontroller devices of NXP Semiconductors .

Table 2-1. S32K14X Derivatives

All of the above microcontroller devices are collectively named as S32K14X.

2.2 Overview

AUTOSAR (**AUTomotive Open System ARchitecture**) is an industry partnership working to establish standards for software interfaces and software modules for automobile electronic control systems.

AUTOSAR

• paves the way for innovative electronic systems that further improve performance, safety and environmental friendliness.

About this Manual

- is a strong global partnership that creates one common standard: "Cooperate on standards, compete on implementation".
- is a key enabling technology to manage the growing electrics/electronics complexity. It aims to be prepared for the upcoming technologies and to improve cost-efficiency without making any compromise with respect to quality.
- facilitates the exchange and update of software and hardware over the service life of the vehicle.

2.3 About this Manual

This Technical Reference employs the following typographical conventions:

Boldface type: Bold is used for important terms, notes and warnings.

Italic font: Italic typeface is used for code snippets in the text. Note that C language modifiers such "const" or "volatile" are sometimes omitted to improve readability of the presented code.

Notes and warnings are shown as below:

Note

This is a note.

2.4 Acronyms and Definitions

Table 2-2. Acronyms and Definitions

| Term | Definition |
|---------|-------------------------------------|
| API | Application Programming Interface |
| ASM | Assembler |
| AUTOSAR | Automotive Open System Architecture |
| BSMI | Basic Software Make file Interface |
| BSW | Basic Software |
| C/CPP | C and C++ Source Code |
| CAN | Controller Area Network |
| DEM | Diagnostic Event Manager |
| DET | Development Error Tracer |
| DFO | Data Flash Optimized |
| DW | Double Word |
| ECC | Error Correcting Code |
| ECU | Electronic Control Unit |

Table continues on the next page...

Integration Manual, Rev. 1.0

Table 2-2. Acronyms and Definitions (continued)

| Term | Definition |
|--------|---|
| EcuM | ECU Manager Module |
| EEPROM | Electrically Erasable Programmable Read-Only Memory |
| FEE | Flash EEPROM Emulation Module/Driver |
| FLS | Flash memory driver |
| ISR | Interrupt Service Routine |
| IVOR | Interrupt Vector Offset Register |
| job | A FEE block operation passed to the module |
| MCU | Microcontroller Unit |
| MemIf | Memory Interface Module |
| N/A | Not Applicable |
| NvM | NVRAM Manager |
| NVRAM | Non-volatile RAM memory |
| os | Operating System |
| RAM | Random Access Memory |
| SchM | Schedule Manager |
| VLE | Variable Length Encoding |
| VSMD | Vendor-Specific Module Definition |
| XML | Extensible Markup Language |

Chapter 3 Building the Driver

This section describes the source files and various compilers, linker options used for building the Autosar FEE driver for NXP SemiconductorsS32K14X . It also explains the EB Tresos Studio plugin setup procedure.

3.1 Build Options

The FEE driver files are compiled using

- Green Hills Multi 7.1.4 / Compiler 2017.1.4
- (Linaro GCC 6.3-2017.06~dev) 6.3.1 20170509 (Wed Jan 24 16:21:45 CST 2018 build.sh rev=g27a1317 s=L631 Earmv7 -V release_g27a1317_build_Fed_Earmv7)
- IAR: V8.11.2

The compiler, linker flags used for building the driver are explained below:

Note

The TS_T40D2M10I1R0 plugin name is composed as follow:

 $TS_T = Target_Id$

D = Derivative_Id

 $M = SW_Version_Major$

 $I = SW_Version_Minor$

R = Revision

(i.e. Target_Id = 40 identifies CORTEXM architecture and Derivative_Id = 2 identifies the S32K14X)

3.1.1 GHS Compiler/Linker/Assembler Options

Table 3-1. Compiler Options

| Option | Description |
|-------------------------------------|--|
| -cpu=cortexm4 | Selects target processor: Arm Cortex M4 |
| -cpu=cortexm0plus | Selects target processor: Arm Cortex M0+ |
| -ansi | Specifies ANSI C with extensions. This mode extends the ANSI X3.159-1989 standard with certain useful and compatible constructs. |
| -Osize | Optimize for size. |
| -dual_debug | Enables the generation of DWARF, COFF, or BSD debugging information in the object file |
| -G | Generates source level debugging information and allows procedure call from debugger's command line. |
| no_exceptions | Disables support for exception handling |
| -Wundef | Generates warnings for undefined symbols in preprocessor expressions |
| -Wimplicit-int | Issues a warning if the return type of a function is not declared before it is called |
| -Wshadow | Issues a warning if the declaration of a local variable shadows the declaration of a variable of the same name declared at the global scope, or at an outer scope |
| -Wtrigraphs | Issues a warning for any use of trigraphs |
| -Wall | Enables all the warnings about constructions that some users consider questionable, and that are easy to avoid even in conjunction with macros. |
| prototype_errors | Generates errors when functions referenced or called have no prototype |
| incorrect_pragma_warnings | Valid #pragma directives with wrong syntax are treated as warnings |
| -noslashcomment | C++ like comments will generate a compilation error |
| -preprocess_assembly_files | Preprocesses assembly files |
| -nostartfile | Do not use Start files |
| short_enum | Store enumerations in the smallest possible type |
| -c | Produces an object file (called input-file.o) for each source file. |
| no_commons | Allocates uninitialized global variables to a section and initializes them to zero at program startup. |
| -keeptempfiles | Prevents the deletion of temporary files after they are used. If an assembly language file is created by the compiler, this option will place it in the current directory instead of the temporary directory. Produces an object file (called input-file.o) for each source file. |
| -list | Creates a listing by using the name of the object file with the .lst extension. Assembler option |
| DAUTOSAR_OS_NOT_USE | -D defines a preprocessor symbol and optionally can set it to a value. AUTOSAR_OS_NOT_USED: By default in the package, the drivers are compiled to be used without Autosar OS. If the drivers are used with Autosar OS, the compiler option '-DAUTOSAR_OS_NOT_USED' must be removed from project options |
| DDISABLE_MCAL_INTERMODULE_ASR_CHECK | -D defines a preprocessor symbol to disable the inter-module version check for AR_RELEASE versions. DISABLE_MCAL_INTERMODULE_ASR_CHECK: By default in the package, drivers are compiled to perform the inter-module version check as per Autosar BSW004. When the inter-module version check needs to be disabled then the DISABLE_MCAL_INTERMODULE_ASR_CHECK global define must be added to the list of compiler options. |
| -DGHS | -D defines a preprocessor symbol and optionally can set it to a value. This one defines the GHS preprocessor symbol. |

Table 3-2. Assembler Options

| Option | Description |
|----------------------------|--|
| -cpu=cortexm4 | Selects target processor: Arm Cortex M4 |
| -cpu=cortexm0plus | Selects target processor: Arm Cortex M0+ |
| -c | Produces an object file (called input-file.o) for each source file. |
| -preprocess_assembly_files | Preprocesses assembly files |
| -asm=list | Creates a listing by using the name of the object file with the .lst extension. Assembler option |

Table 3-3. Linker Options

| Option | Description |
|--------------------------|--|
| -Mn | Map file numeric ordering |
| -delete | Removal from the executable of functions that are unused and unreferenced |
| -V | Display removed unused functions |
| -ignore_debug_references | Ignores relocations from DWARF debug sections when using -delete. |
| -map | Creates a detailed map file |
| -keepmap | Keep the map file in the event of a link error |
| -Istartup | Link libstartup library -Run-time environment startup routines |
| -lsys | Link libsys library -Run-time environment system routines |
| -larch | Link libarch library -Target-specific run-time support. Any file produced by the Green Hills Compiler may depend on symbols in this library. |
| -lansi | Link libansi library -the standard C library |
| -L(/lib/thumb2) | Link thumb2 library |
| -lutf8_s32 | Include utf8_s32.a to use the Wide Character Functions |

3.1.2 IAR Compiler/Linker/Assembler Options

Table 3-4. Compiler Options

| Option | Description |
|----------------------|---|
| cpu=Cortex-M4 | Selects target processor: Arm Cortex M4 |
| cpu=Cortex-M0+ | Selects target processor: Arm Cortex M0+ |
| cpu_mode=thumb | Selects generating code that executes in Thumb state. |
| endian=little | Specifies the endianess of core: little endian. |
| -Ohz | Sets the optimization level to High, favoring size. |
| -c | Produces an object file (called input-file.o) for each source file. |
| no_clustering | Disables static clustering optimizations. |
| no_mem_idioms | Makes the compiler to not optimize code sequences that clear, set, or copy a memory region. |
| no_explicit_zero_opt | Places the zero initialized variables in data section instead of bss. |
| debug | Makes the compiler include information in the object modules. |

Table continues on the next page...

Integration Manual, Rev. 1.0

Build Options

Table 3-4. Compiler Options (continued)

| Option | Description |
|---------------------|---|
| diag_suppress=Pa050 | Suppresses diagnostic messages (warnings) about non-standard line endings. |
| DAUTOSAR_OS_NOT_USE | -D defines a preprocessor symbol and optionally can set it to a value. AUTOSAR_OS_NOT_USED: By default in the package, the drivers are compiled to be used without Autosar OS. If the drivers are used with Autosar OS, the compiler option '-DAUTOSAR_OS_NOT_USED' must be removed from project options |
| -DIAR | -D defines a preprocessor symbol and optionally can set it to a value. This one defines the IAR preprocessor symbol. |
| require_prototypes | Forces the compiler to verify that all functions have proper prototypes. |
| no_wrap_diagnostics | Disables line wrapping of diagnostic messages issued by compiler. |
| no_system_include | Disables the automatic search for system include files. |
| -е | Enables language extensions. This option is needed by FLS driver which uses _packed structures. |

Table 3-5. Assembler Options

| Option | Description |
|----------------|---|
| cpu=Cortex-M4 | Selects target processor: Arm Cortex M4 |
| cpu=Cortex-M0+ | Selects target processor: Arm Cortex M0+ |
| cpu_mode=thumb | Selects generating code that executes in Thumb state. |
| -g | Use this option to disable the automatic search for system include files. |

Table 3-6. Linker Options

| Option | Description |
|-----------------------------|--|
| cpu=Cortex-M4 | Selects target processor: Arm Cortex M4 |
| cpu=Cortex-M0+ | Selects target processor: Arm Cortex M0+ |
| map filename | Produces a map file. |
| no_library_search | Disables automatic runtime library search. |
| entry _start | Treats the symbol _start as a root symbol and as the start of the application. |
| enable_stack_usage | Enables stack usage analysis. |
| skip_dynamic_initialization | Suppress dynamic initialization during system startup. |
| no_wrap_diagnostics | Disables line wrapping of diagnostic messages issued by linker. |
| config | Specifies the configuration file to be used by the linker. |

Integration Manual, Rev. 1.0

3.1.3 GCC Compiler/Linker/Assembler Options

Table 3-7. Compiler Options

| Option | Description |
|---------------------------------------|---|
| -c | Produces an object file (called input-file.o) for each source file. |
| -Os | Use optimization for size. |
| -ggdb3 | Produce debugging information for use by GDB. Level 3 includes extra information, such as all the macro definitions present in the program. |
| -mcpu=cortex-m4 | Selects target processor: Arm Cortex M4 |
| -mcpu=cortex-m0plus | Selects target processor: Arm Cortex M0+ |
| -mthumb | Selects generating code that executes in Thumb state. |
| -ansi | Specifies ANSI C with extensions. |
| -mlittle-endian | Generate code for a processor running in little-endian mode. |
| -fomit-frame-pointer | Removes the frame pointer for all functions, which might make debugging harder. |
| -msoft-float | Use software floating-point instructions. |
| -fno-common | Specifies that the compiler should place uninitialized global variables in the data section of the object file, rather than generating them as common blocks. |
| -Wall | Enables all the warnings about constructions that some users consider questionable, and that are easy to avoid even in conjunction with macros. |
| -Wextra | Enables some extra warning flags that are not enabled by '-Wall'. |
| -Wstrict-prototypes | Warn if a function is declared or defined without specifying the argument types. |
| -Wno-sign-compare | Do not warn when a comparison between signed and unsigned values could produce an incorrect result when the signed value is converted to unsigned. |
| -fstack-usage | Geneates an extra file that specifies the maximum amount of stack used, on a per-function basis. |
| -fdump-ipa-all | Enables all inter-procedural analysis dumps. |
| -Werror=implicit-function-declaration | Generates an error when the prototype of the function is not defined |
| DAUTOSAR_OS_NOT_USE | -D defines a preprocessor symbol and optionally can set it to a value. AUTOSAR_OS_NOT_USED: By default in the package, the drivers are compiled to be used without Autosar OS. If the drivers are used with Autosar OS, the compiler option '-DAUTOSAR_OS_NOT_USED' must be removed from project options |
| -DGCC | -D defines a preprocessor symbol and optionally can set it to a value. This one defines the GCC preprocessor symbol. |
| -std=c99 | C programming language standard version c99 |

Table 3-8. Assembler Options

| Option | Description | | |
|-----------------------|--|--|--|
| -mcpu=cortex-m4 | Selects target processor: Arm Cortex M4 | | |
| -mcpu=cortex-m0plus | Selects target processor: Arm Cortex M0+ | | |
| -c | Produces an object file (called input-file.o) for each source file. | | |
| -mthumb | This option specifies that the assembler should start assembling Thumb instructions. | | |
| -x assembler-with-cpp | Indicates that the assembly code contains C directives and the C preprocessor must be run. | | |

Files Required for Compilation

Table 3-9. Linker Options

| Option | Description | | |
|--|---|--|--|
| -Map=filename | Print a link map to the file mapfile. | | |
| -T scriptfile | Use scriptfile as the linker script. This script replaces Id's default linker script(rather than adding to it), so commandfile must specify everything necessary to describe the output file. | | |
| disable-newlib-supplied- syscalls -specs=nosys.specs | These options support for using newlib on core M0+ | | |
| -u _printf_float -u _scanf_float | These options support generating profile report. | | |
| -nostartfiles | Do not use the standard system startup files when linking | | |
| -e _start | Specify that the program entry point is _start | | |
| -static | Thestatic flag tells the linker to link a static, not a dynamically linked | | |
| -lc | The -lc flag tells the linker to link this binary against the C library, which is newlib in our case. | | |
| -lnosys | The -Inosys flag tells the linker to link this binary against the "nosys" library | | |
| \$(TOOLCHAIN_DIR)/arm- none-eabi/newlib/lib/ thumb/v6-m \$ (TOOLCHAIN_DIR)/lib/gcc/ arm-none-eabi/6.3.1/ thumb/v6-m | Library for core M0+, added with -L and -B option | | |
| \$(TOOLCHAIN_DIR)/arm- none-eabi/newlib/lib/thumb \$ (TOOLCHAIN_DIR)/arm- none-eabi/newlib/lib) | Library for core M4, added with -L and -B option | | |

3.2 Files Required for Compilation

This section describes the include files required to compile, assemble (if assembler code) and link the FEE driver for S32K14X microcontrollers.

To avoid integration of incompatible files, all the include files from other modules shall have the same AR_MAJOR_VERSION and AR_MINOR_VERSION, i.e. only files with the same AUTOSAR major and minor versions can be compiled.

FEE Files

- ..\Fee_TS_T40D2M10I1R0\src\Fee.c
- ..\Fee_TS_T40D2M10I1R0\include\Fee_Cbk.h
- ..\Fee TS T40D2M10I1R0\include\Fee.h
- ..\Fee_TS_T40D2M10I1R0\include\Fee_InternalTypes.h
- ..\Fee_TS_T40D2M10I1R0\include\Fee_Types.h

- Fee_Cfg.h this file should be generated by the user using a configuration/generation tool
- Fee_Cfg.c this file should be generated by the user using a configuration/generation tool

Other includes files:

Files from the MemIf folder:

• ..\MemIf TS T40D2M10I1R0\include\MemIf Types.h

Files from the Base common folder

- ..\Base TS T40D2M10I1R0\include\Compiler.h
- ..\Base_TS_T40D2M10I1R0\include\Compiler_Cfg.h
- ..\Base TS T40D2M10I1R0\include\Fee MemMap.h
- ..\Base_TS_T40D2M10I1R0\include\Platform_Types.h
- ..\Base TS T40D2M10I1R0\include\Mcal.h
- ..\Base_TS_T40D2M10I1R0\include\Std_Types.h

Files from the Det folder:

• ..\Det TS T40D2M10I1R0\include\Det.h

Files from the Fls folder:

• ..\Fls TS T40D2M10I1R0\include\Fls.h

3.3 Setting up the Plug-ins

The FEE driver was designed to be configured by using the EB tresos® (version EB tresos Studio 24.0.1 b180321-0610 or later.)

- VSMD (Vendor Specific Module Definition) file in EB tresos® XDM format:
 - ..\Fee TS T40D2M10I1R0\config\Fee.xdm
- VSMD (Vendor Specific Module Definition) file in AUTOSAR compliant EPD format:
 - ..\Fee TS T40D2M10I1R0\autosar\Fee.epd
- Code generation templates for pre-compile time configuration parameters:
 - ..\Fee_TS_T40D2M10I1R0 \generate\include\Fee_Cfg.h
 - ..\Fee_TS_T40D2M10I1R0 \generate\src\Fee_Cfg.c

Steps to generate the configuration:

- 1. Copy the module folders Fee_TS_T40D2M10I1R0, Fls_TS_T40D2M10I1R0, Base_TS_T40D2M10I1R0, Resource_TS_T40D2M10I1R0, EcuC_TS_T40D2M10I1R0 into the EB tresos® plugins folder.
- 2. Set the desired output location folder for the generated sources and header files.

Setting up the Plug-ins

- 3. Use the EB tresos® GUI to modify ECU configuration parameters values.
- 4. Generate the configuration files.

Chapter 4 Function calls to module

4.1 Function Calls During Start-up

FEE shall be initialized during STARTUP2 phase of EcuM initialization. The API member to be called to accomplish this is Fee_Init.

Notes:

- Fee module is the upper layer module which works on FLS module.
- Fls_Init function must be called before calling the Fee_Init.
- Fee_MainFunction and Fls_MainFunction routines must be called repeatedly for the FEE module initialization and its operation. When an operation (initialization or standard one) finishes, the Fee_GetStatus returns MEMIF_IDLE.

4.2 Function Calls During Shutdown

None.

4.3 Function Calls During Wake-up

None.

Function Calls During Wake-up

Chapter 5 Module requirements

5.1 Exclusive areas to be defined in BSW scheduler

In the current implementation, FEE is using the services of Run-Time Environment (RTE) for entering and exiting the critical regions. RTE implementation is done by the integrators of the MCAL using OS or non-OS services. For testing the FEE, stubs are used for RTE.

FEE driver has four exclusive areas (EA) FEE_EXCLUSIVE_AREA_00, FEE_EXCLUSIVE_AREA_01, FEE_EXCLUSIVE_AREA_02, and FEE_EXCLUSIVE_AREA_03. The purpose of these exclusive areas is to make the functions Fee_Read, Fee_Write, Fee_InvalidateBlock and Fee_EraseImmediateBlock thread safe and thus protect FEE internal job variables.

Critical Region Exclusive Matrix

Below is the table depicting the exclusivity between different critical region IDs from the FEE driver. If there is an "X" in a table, it means that those 2 critical regions cannot interrupt each other.

FEE EXCLUSIVE AREA 00 Used in Fee Read.

FEE_EXCLUSIVE_AREA_01 Used in Fee_Write.

FEE_EXCLUSIVE_AREA_02 Used in Fee_InvalidateBlock.

FEE_EXCLUSIVE_AREA_03 Used in Fee_EraseImmediateBlock.

Table 5-1. Exclusive Areas

| | FEE_EXCLUSIVE_AR | FEE_EXCLUSIVE_AR | FEE_EXCLUSIVE_AR | FEE_EXCLUSIVE_AR |
|------------------------|------------------|------------------|------------------|------------------|
| | EA_00 | EA_01 | EA_02 | EA_03 |
| FEE_EXCLUSIVE_AR EA_00 | | x | x | x |

Table continues on the next page...

Table 5-1. Exclusive Areas (continued)

| | FEE_EXCLUSIVE_AR EA_00 | FEE_EXCLUSIVE_AR EA_01 | FEE_EXCLUSIVE_AR EA_02 | FEE_EXCLUSIVE_AR EA_03 |
|---------------------------|---------------------------|---------------------------|---------------------------|---------------------------|
| FEE_EXCLUSIVE_AR EA_01 | x | | X | X |
| FEE_EXCLUSIVE_AR EA_02 | x | x | | X |
| FEE_EXCLUSIVE_AR EA_03 | x | x | X | |

5.2 Peripheral Hardware Requirements

The FEE module is hardware independent module and depends on the underlying FLS module and its configuration only.

5.3 ISR to Configure within OS – Dependencies

None.

5.4 ISR Macro

None.

5.5 Other AUTOSAR Modules Dependencies

- **Base:** The BASE module contains the common files/definitions needed by all MCAL modules.
- **Det:** The DET module is used for enabling Development error detection. The API function used is Det_ReportError(). The activation / deactivation of Development error detection is configurable using the 'FeeDevErrorDetect' configuration parameter.
- **MemIf:** This module allows the NVRAM manager to access several memory abstraction modules.
- **Resource:** Resource module is used to select microcontroller's derivatives.

- **Fls:** The flash driver provides services for reading, writing and erasing flash memory and a configuration interface for modifying the write/erase protection if supported by the underlying hardware.
- EcuC: The ECUC module is used for ECU configuration. MCAL modules need ECUC to retrieve the variant information
- **Rte:** The RTE module is needed for implementing data consistency of exclusive areas that are used by FEE module.

5.6 Data Cache Restriction

To achieve the same robustness as in the previous platforms, due to ECC page restriction and CACHE coherency issues, it is recommended to set the FeeVirtualPageSize to 16 bytes. For more details about ECC and cache coherency issues please see the FLS driver integration manual.

5.7 User Mode support

The Fee driver can be run in user mode

User Mode support

Chapter 6 Main API Requirements

6.1 Main Function Calls Within BSW Scheduler

- Fee_MainFunction()
- Fls_MainFunction()

Call rate depends on target application, i.e. how fast the data must be read/written/compared.

6.2 API Requirements

Before calling the Fee_Write() function for immediate data, the function Fee_EraseImmediateBlock() must be called to pre-erase the flash area.

6.3 Calls to Notification Functions, Callbacks, Callouts

The FEE module provides user-configurable notifications

- FeeNvMJobEndNotification,
- FeeNvMJobErrorNotification,
- FeeClusterFormatNotification.

FeeNvMJobEndNotification and FeeNvMJobErrorNotification are usually routed to the NvM. FeeClusterFormatNotification is called by Fee to inform the user in case a cluster format is triggered during the Fee initialization.

Additionally, the FEE module publishes two APIs

- Fee_JobEndNotification: This callback notification is used by the underlying FLS module to report the successful end of an FLS operation.
- Fee_JobErrorNotification: This callback notification is used by the underlying FLS module to report the failure of an FLS operation.

Calls to Notification Functions, Callbacks, Callouts

Both callbacks must be configured in the FLS module (notifications) regardless of its operation mode (synchronous or asynchronous).

Chapter 7 Memory Allocation

7.1 Sections to Be Defined in Fee_MemMap.h

For precompile:

```
#ifdef FEE_START_SEC_CONST_UNSPECIFIED
#undef FEE_START_SEC_CONST_UNSPECIFIED
#undef MEMMAP_ERROR
/*no definition -> default compiler settings are used */
#endif
#ifdef FEE_STOP_SEC_CONST_UNSPECIFIED
#undef FEE_STOP_SEC_CONST_UNSPECIFIED
#undef MEMMAP_ERROR
/*no definition -> default compiler settings are used */
#endif
```

For code:

```
#ifdef FEE_START_SEC_CODE
#undef FEE_START_SEC_CODE
#undef MEMMAP_ERROR
/*no definition -> default compiler settings are used */
#endif
#ifdef FEE_STOP_SEC_CODE
#undef FEE_STOP_SEC_CODE
#undef MEMMAP_ERROR
/*no definition -> default compiler settings are used */
#endif
```

For variables:

```
#ifdef FEE_START_SEC_VAR_INIT_8
#undef FEE_START_SEC_VAR_INIT_8
#undef MEMMAP_ERROR
/*no definition -> default compiler settings are used */
#endif
#ifdef FEE_STOP_SEC_VAR_INIT_8

7.2 Linker Command File

Memory shall be allocated for every section defined in Fee_MemMap.h.

Chapter 8 Configuration parameters considerations

Configuration parameter class for Autosar FEE driver fall into the following variants as defined below:

8.1 Configuration Parameters

Configuration parameter class for AUTOSAR FEE driver fall into the following variants as defined below:

Table 8-1. Configuration Parameters

| Configuration List- Container | Configuration Parameters | Configuration Variant | Current Implementation |
|----------------------------------|------------------------------|-----------------------|------------------------|
| FeeGeneral | | | |
| | FeeDevErrorDetect | VariantPreCompile | PreCompile |
| | FeeMainFunctionPeriod | VariantPreCompile | PreCompile |
| | FeeNvmJobEndNotification | VariantPreCompile | PreCompile |
| | FeeNvmJobErrorNotification | VariantPreCompile | PreCompile |
| | FeeClusterFormatNotification | VariantPreCompile | PreCompile |
| | FeePollingMode | VariantPreCompile | PreCompile |
| | FeeSetModeSupported | VariantPreCompile | PreCompile |
| | FeeVersionInfoApi | VariantPreCompile | PreCompile |
| | FeeVirtualPageSize | VariantPreCompile | PreCompile |
| | FeeDataBufferSize | VariantPreCompile | PreCompile |
| | FeeBlockAlwaysAvailable | VariantPreCompile | PreCompile |
| | FeeLegacyMode | VariantPreCompile | PreCompile |
| | FeeLegacyEraseMode | VariantPreCompile | PreCompile |
| | FeeSwapForeignBlocksEnabled | VariantPreCompile | PreCompile |
| | FeeMarkEmptyBlocksInvalid | VariantPreCompile | PreCompile |
| | FeeConfigAssignment | VariantPreCompile | PreCompile |
| | FeeMaximumNumberBlocks | VariantPreCompile | PreCompile |
| FeeBlockConfiguration | | | |

Table continues on the next page...

Configuration Parameters

Table 8-1. Configuration Parameters (continued)

| Configuration List- Container | Configuration Parameters | Configuration Variant | Current Implementation |
|----------------------------------|--------------------------|-----------------------|---------------------------|
| | FeeClusterGroupRef | VariantPreCompile | PreCompile |
| | FeeBlockNumber | VariantPreCompile | PreCompile |
| | FeeBlockSize | VariantPreCompile | PreCompile |
| | FeeImmediateData | VariantPreCompile | PreCompile |
| | FeeBlockAssignment | VariantPreCompile | PreCompile |
| | FeeNumberOfWriteCycles | VariantPreCompile | PreCompile |
| | FeeDeviceIndex | VariantPreCompile | PreCompile |
| FeeClusterGroup | | | |
| | FeeCluster | VariantPreCompile | PreCompile |
| FeeCluster | | | |
| | FeeSector | VariantPreCompile | PreCompile |
| FeeSector | | | |
| | FeeSectorRef | VariantPreCompile | PreCompile |
| | FeeSectorIndex | VariantPreCompile | PreCompile |

Chapter 9 Integration Steps

This section gives a brief overview of the steps needed for integrating Flash EEPROM Emulation:

- Generate the required FEE configurations. For more details refer to section Files Required for Compilation
- Allocate proper memory sections in FEE_MemMap.h and linker command file. For more details refer to section Sections to Be Defined in Fee_MemMap.h
- Compile & build the FEE with all the dependent modules. For more details refer to section Building the Driver

Chapter 10 ISR Reference

None

Chapter 11 External Assumptions for FEE driver

The section presents requirements that must be complied with when integrating FEE driver into the application.
